

SHIVRAI HON

Whitepaper v2.0

An Independent Decentralized Cryptocurrency
Built on Bitcoin Core Technology

Parameter	Value
Coin Name	SHIVRAI HON
Symbol	HON
Block Reward	2000 HON
Block Time	5 Minutes
Algorithm	SHA-256 Proof of Work
Halving	OFF (210M block interval)
Total Supply	Unlimited
P2P Port	8444
RPC Port	8332

June 2026

Inspired by Chhatrapati Shivaji Maharaj

Table of Contents

1. Introduction
2. Background and Motivation
3. Technical Architecture
4. Mining and Consensus
5. Network Infrastructure
6. Windows Miner v2.0
7. Wrapped HON (wHON) and DeFi Integration
8. Tokenomics
9. Security Model
10. Roadmap
11. Ecosystem and Links
12. Conclusion

1. Introduction

SHIVRAI HON (HON) is an independent decentralized cryptocurrency built as a fork of Bitcoin Core. Named after the historic Shivrai Hon gold coin minted during the coronation of Chhatrapati Shivaji Maharaj, the project carries forward the spirit of sovereignty, independence, and community empowerment into the digital age.

SHIVRAI HON operates on its own proof-of-work blockchain using the SHA-256 mining algorithm. The network features a block reward of 2000 HON per block with a target block time of 5 minutes, making it one of the most rewarding mineable cryptocurrencies in existence. With zero pre-mine, zero ICO, and a fair launch model, SHIVRAI HON is designed to be truly community-driven from day one.

The project provides a complete ecosystem including a blockchain explorer, mining dashboard, Windows-based mining software, and plans for decentralized exchange integration through a wrapped token (wHON) on the Polygon network.

2. Background and Motivation

The cryptocurrency landscape is dominated by projects that prioritize institutional investors, venture capital funding, and complex tokenomics that alienate ordinary users. Many modern cryptocurrencies launch with significant pre-mines, insider allocations, and ICOs that concentrate wealth among early investors.

SHIVRAI HON was created to return to the original vision of cryptocurrency: a peer-to-peer digital currency that anyone can mine, hold, and transfer without intermediaries. By forking Bitcoin Core, the most battle-tested and secure blockchain codebase in existence, SHIVRAI HON inherits decades of security research and development while offering significantly higher block rewards and faster confirmation times.

The name SHIVRAI HON is a tribute to the historic gold coin that symbolized Maratha sovereignty. Just as the original Shivrai Hon represented economic independence, the digital SHIVRAI HON represents financial freedom in the modern era.

3. Technical Architecture

SHIVRAI HON is built on the Bitcoin Core codebase, specifically forked from the latest stable release. The following modifications were made to create an independent blockchain:

3.1 Network Parameters

Parameter	Value	Description
-----------	-------	-------------

P2P Port	8444	Peer-to-peer network communication
RPC Port	8332	Remote procedure call interface
Block Time	5 Minutes	Target time between blocks
Block Reward	2000 HON	Coinbase reward per block
Halving Interval	210,000,000 blocks	Effectively disabled
powLimit	7fff...ffff	Easy initial mining difficulty
Address Prefix	bc1	Bech32 address format

3.2 Genesis Block

The SHIVRAI HON blockchain begins with a custom genesis block with the following hash:

48cf4d03834c2cde729ab246d525e55e7f8971e0984e4700baedcf0dab941b37

The genesis block timestamp is set to 1748956800 (June 2025), marking the official birth of the SHIVRAI HON network. The powLimit is set to the maximum value (7fff), ensuring that mining is accessible to all participants from the very first block.

4. Mining and Consensus

SHIVRAI HON uses SHA-256 Proof of Work as its consensus mechanism, the same algorithm that secures Bitcoin. This means that the network benefits from the extensive security research and battle-testing that SHA-256 has undergone since Bitcoin's inception in 2009.

4.1 Block Rewards

Each successfully mined block rewards the miner with 2000 HON. This is significantly higher than Bitcoin's current block reward, making SHIVRAI HON attractive for individual miners using consumer-grade hardware. The high block reward ensures broad distribution of coins across the community.

4.2 Halving Policy

Unlike Bitcoin, which halves its block reward approximately every 4 years, SHIVRAI HON has set the halving interval to 210 million blocks. At a 5-minute block time, this means halving would not occur for approximately 2,000 years, effectively disabling the mechanism. This design choice ensures consistent, predictable mining rewards for the foreseeable future, encouraging long-term participation in the network.

4.3 Mining Accessibility

The initial difficulty (powLimit) is set to the maximum value, making mining accessible even on standard consumer CPUs. As the network grows and more miners join, the difficulty will adjust automatically through Bitcoin's proven difficulty adjustment algorithm, maintaining the 5-minute target block time.

5. Network Infrastructure

SHIVRAI HON operates a fully decentralized peer-to-peer network. The current network infrastructure includes:

Component	Details
Public Seed Node	bore.pub:34969 (TCP tunnel)
Block Explorer	shivrai-hon-explorer.onrender.com
Mining Dashboard	shivrai-hon-explorer.onrender.com/mining.html
Project Website	ktusharuxd-afk.github.io/shivrai-hon-website
Secure API Server	hon-secure-server.onrender.com

Source Code	github.com/ktusharuxd-afk/shivrai-hon-core
-------------	---

The seed node enables new miners and nodes to discover and connect to the network automatically. The block explorer provides real-time visibility into all blockchain activity, including blocks, transactions, and network statistics.

6. Windows Miner v2.0

The Windows Miner v2.0 is a complete, ready-to-use mining package designed for users with no technical background. The package includes all necessary executables, libraries, and configuration scripts.

6.1 Package Contents

File	Purpose
bitcoind.exe	HON node daemon (22.6 MB)
bitcoin-cli.exe	Command-line interface (5.2 MB)
1_START_NODE.bat	Auto-config and node startup
2_CONTROL_PANEL.bat	Mining control panel (Marathi)
50+ DLL files	Required runtime libraries
README.txt	Setup and usage guide

6.2 Setup Process

1. Download the Windows Miner v2.0 ZIP from the GitHub Releases page.
2. Extract all files to a folder (e.g., C:\SHIVRAI-HON\).
3. Double-click 1_START_NODE.bat to start the node. Configuration and data directories are created automatically.
4. Open 2_CONTROL_PANEL.bat in a separate window to access the mining control panel.
5. Generate a new address (option 3), then start mining (option 4) to earn 2000 HON per block.

7. Wrapped HON (wHON) and DeFi Integration

To enable SHIVRAI HON to participate in the broader decentralized finance (DeFi) ecosystem, a wrapped version of HON (wHON) is being developed as an ERC-20 token on the Polygon network.

7.1 Current Status

The wHON ERC-20 smart contract has been successfully deployed on the Polygon Amoy testnet at address 0x75Ba5C2D2166174af340B8466867A014b2D316AC. Mainnet deployment on Polygon is the next milestone.

7.2 Bridge Architecture

A two-way bridge will enable conversion between native HON (on the SHIVRAI HON blockchain) and wHON (on the Polygon network). Users will be able to lock HON on the native chain to mint equivalent wHON on Polygon, and burn wHON to unlock the corresponding HON on the native chain.

7.3 DEX Integration

Once wHON is deployed on Polygon mainnet, it will be listed on decentralized exchanges such as Uniswap and PancakeSwap. This will enable global, permissionless trading of HON without centralized intermediaries. The planned trading pairs include wHON/USDT, wHON/POL, and wHON/ETH.

8. Tokenomics

SHIVRAI HON follows a fair and transparent token distribution model with no pre-mine, no ICO, and no team allocation. All HON coins are distributed exclusively through mining.

Metric	Value
Total Supply	Unlimited (no hard cap)
Distribution	100% through mining
Pre-mine	None (0%)
ICO/IDO	None
Team Allocation	None
Block Reward	2000 HON per block

Halving	Effectively disabled
Emission Rate	~576,000 HON per day

The emission rate calculation: 2000 HON per block, with 288 blocks per day (24 hours / 5 minutes), yields approximately 576,000 HON mined per day across the entire network.

9. Security Model

SHIVRAI HON inherits the robust security model of Bitcoin Core, which has been continuously developed and audited since 2009. Key security features include:

SHA-256 Proof of Work: The most extensively tested mining algorithm in cryptocurrency history. Any attack on SHA-256 would simultaneously threaten Bitcoin, ensuring that significant resources are dedicated to maintaining the algorithm's security.

Decentralized Consensus: No single entity controls the network. Consensus is achieved through the collective work of all miners, with the longest valid chain being accepted as the canonical chain.

Cryptographic Security: All transactions are secured using ECDSA (Elliptic Curve Digital Signature Algorithm) with the secp256k1 curve, the same cryptographic standard used by Bitcoin.

Peer-to-Peer Network: The decentralized P2P network ensures that there is no single point of failure. Each node independently validates all transactions and blocks.

10. Roadmap

Phase	Status	Milestones
1. Foundation	Completed	Bitcoin Core fork, custom genesis block, 2000 HON reward, SHA-256 mining
2. Infrastructure	Completed	Block explorer, mining dashboard, website, whitepaper, documentation
3. Windows Miner v2.0	Completed	Complete mining package, auto-setup, control panel, GitHub Release
4. Network Launch	Completed	Public seed node, multiple nodes connected, 404,000+ HON mined
5. Wrapped HON	In Progress	wHON ERC-20 on Polygon, testnet deployed, mainnet upcoming
6. DEX Listing	Upcoming	Uniswap/PancakeSwap listing via HON-wHON bridge
7. Exchange Tracking	Upcoming	CoinGecko, CoinMarketCap listing, community growth
8. Ecosystem	Future	Digital Currency app, merchant payments, DAO governance

12. Conclusion

SHIVRAI HON represents a return to the fundamental principles of cryptocurrency: decentralization, accessibility, and community ownership. By building on the proven Bitcoin Core foundation while offering significantly higher mining rewards and faster block times, SHIVRAI HON creates an opportunity for anyone to participate in the cryptocurrency ecosystem.

With a complete infrastructure already in place including a block explorer, mining dashboard, Windows mining software, and a public seed node, the project is ready for community adoption. The upcoming deployment of wHON on the Polygon network and subsequent DEX listing will further expand the ecosystem and enable global trading.

SHIVRAI HON is more than a cryptocurrency. It is a tribute to the spirit of sovereignty and independence embodied by Chhatrapati Shivaji Maharaj, brought to life in the digital age for a new generation.
