

SHIVRAI HON

An Independent Decentralized Digital Currency

Whitepaper v3.1 | August 2026

Parameter	Value
Coin Name	SHIVRAI HON
Symbol	HON
Block Reward	2000 HON (Year 1)
Block Time	8 Hours
Halving	Every 210,000 blocks (~1 year)
Reward Cycle	12-year cycle, resets to 2000 HON
Algorithm	HONPoW (SHA256D)
Pre-mine	None
Launch	June 2026

"Inspired by Chhatrapati Shivaji Maharaj"

Abstract

SHIVRAI HON is a fully independent, decentralized digital currency that enables peer-to-peer value transfer without the need for any central authority, bank, or intermediary. The network uses a custom proof-of-work algorithm called HONPoW, which allows any participant to mine new coins using standard computing hardware. Every coin in circulation is earned through mining — there is no pre-mine, no ICO, and no team allocation. The system follows a structured 12-year reward cycle designed for long-term fairness and sustainability.

1. Introduction

The modern financial system relies on trusted third parties — banks, payment processors, and governments — to facilitate transactions and maintain records. This dependence creates single points of failure, excludes large populations from financial services, and concentrates power in the hands of a few institutions.

SHIVRAI HON proposes an alternative: a self-sustaining monetary network where trust is replaced by cryptographic proof. Named after the historic Shivrai Hon gold coin minted during the reign of Chhatrapati Shivaji Maharaj, this project carries the spirit of sovereignty and self-reliance into the digital age.

The key properties of the system are: decentralization (no single entity controls the network), fairness (all coins are distributed through mining), accessibility (any computer can participate), and predictability (a fixed, transparent 12-year reward cycle governs emission).

2. The HONPoW Algorithm

HONPoW is the consensus algorithm that secures the SHIVRAI HON network. It belongs to the family of proof-of-work systems, where miners compete to find a valid hash for each new block. The first miner to find a valid solution earns the right to add the block to the chain and receives the block reward.

Security — The computational work required to produce a valid block makes it economically infeasible to tamper with the blockchain. Altering any historical block would require redoing the work for that block and every block after it.

Fairness — HONPoW is designed to be mineable on consumer-grade hardware, keeping the barrier to entry low so that anyone with a computer and an internet connection can participate.

Stability — The network automatically adjusts mining difficulty to maintain a consistent 8-hour target between blocks, regardless of how many miners join or leave the network.

3. Transactions

A SHIVRAI HON transaction is a digitally signed message that transfers ownership of coins from one address to another. Each transaction references previous unspent outputs as inputs, specifies new outputs, and includes a cryptographic signature proving the sender owns the coins being spent.

Transactions are broadcast to all nodes in the network. Miners collect pending transactions into a candidate block, then perform proof-of-work to find a valid hash. Once found, the block is broadcast, verified by other nodes, and accepted into their copy of the blockchain.

4. Network

The SHIVRAI HON network operates as a peer-to-peer system. Nodes connect to each other directly, share new transactions and blocks, and independently verify the validity of all data they receive. There is no central server — the network is maintained entirely by its participants.

In the event of conflicting chains, nodes always follow the longest valid chain — the one with the most cumulative proof-of-work — ensuring the network converges on a single agreed history without any central coordinator.

5. Mining and Incentive

Mining serves two purposes: it secures the network by making attacks computationally expensive, and it provides a fair mechanism for distributing new coins. In Year 1, every successfully mined block rewards the miner with 2000 HON.

SHIVRAI HON follows a structured 12-year reward cycle. The block reward halves approximately every year (every 210,000 blocks), before resetting back to 2000 HON at the start of each new 12-year cycle. This balances long-term scarcity within each cycle against sustained mining incentive across cycles.

6. Security

The security of SHIVRAI HON rests on three pillars: cryptographic proof-of-work, decentralized consensus, and economic incentives.

An attacker attempting to alter the blockchain would need to redo the proof-of-work for the target block and all subsequent blocks, then outpace the honest network — requiring control of more than 50% of the network's total mining power.

All transactions are secured using elliptic curve digital signatures (ECDSA with secp256k1). A private key is mathematically linked to a public address but cannot be derived from it.

7. Tokenomics

Metric	Value
Distribution	100% mining
Pre-mine	None
ICO / IDO	None
Team Allocation	None
Block Reward (Year 1)	2000 HON
Halving Interval	Every 210,000 blocks
Reward Cycle	12 years, then resets
Block Time	8 hours

The tokenomics of SHIVRAI HON follow the purest possible model: every coin is earned, never created out of thin air for insiders.

8. Cross-Chain Interoperability

To enable participation in the broader decentralized finance ecosystem, a wrapped version of HON (wHON) is available as a BEP-20 token on BNB Smart Chain, live and tradeable on PancakeSwap.

The bridge mechanism follows a lock-and-mint model: HON is locked on the native chain, and an equivalent amount of wHON is minted on the target network. The reverse process burns wHON and unlocks the corresponding HON, keeping total supply consistent across both chains.

9. Vision

SHIVRAI HON is built on a simple conviction: money should serve the people who use it, not the institutions that control it. In an era of increasing financial surveillance and exclusion from basic financial services, the need for a sovereign, community-owned currency has never been greater.

Just as the original Shivrai Hon gold coin symbolized the economic independence of a people, SHIVRAI HON represents the possibility of financial sovereignty in the digital age.

10. Conclusion

This paper has presented SHIVRAI HON — an independent, decentralized digital currency secured by the HONPoW algorithm, achieving trustless peer-to-peer value transfer through cryptographic proof-of-work.

The structured 12-year reward cycle balances long-term incentive with disciplined emission. The absence of any pre-mine or insider allocation creates a level playing field.

SHIVRAI HON is not merely a cryptocurrency. It is an invitation to participate in building a financial system that belongs to everyone.
